

## The Volvo Penta Green Commitment

Reducing environmental impact is a global challenge. As industry leaders in leisure boat power, our commitment includes:

- Revolutionary propulsion systems that offer a better boating experience and a dramatic cut in CO2 emissions.

- State-of-the-art engines that deliver more performance and less environmental impact.
- Smart accessories that enable eco-driving.
- Manufacturing in environmentally certified (ISO 14001) world-class production facilities.

The Volvo Penta Green Commitment is a benefit to you and to the environment.

## Research and development

The fact that Volvo Penta offers the environmentally most efficient drive systems is not by chance. Volvo Penta invests about 5 % of its turnover in product development. To this

should be added the approximately EUR 1 billion the Volvo Group invests every year which is largely used to develop ultramodern environmental technology.

## State of the art engines

Thanks to extensive use of advanced technology and the fact that all engines are developed for marine requirements - Volvo Penta engines can deliver more performance and less environmental impact.

We also build engines that satisfy the most comprehensive requirements and then sell these versions all over the world. We thus do not sell less clean engines in a market just because it is permitted.

## Environmental boating

As a boat driver and boat owner, you have great opportunities to reduce environmental impact. In everything from driving style to boat and engine maintenance you can contribute to reduced emissions.

The difference between doing everything wrong and doing everything right could be a 50% reduction in fuel consumption and emissions!
